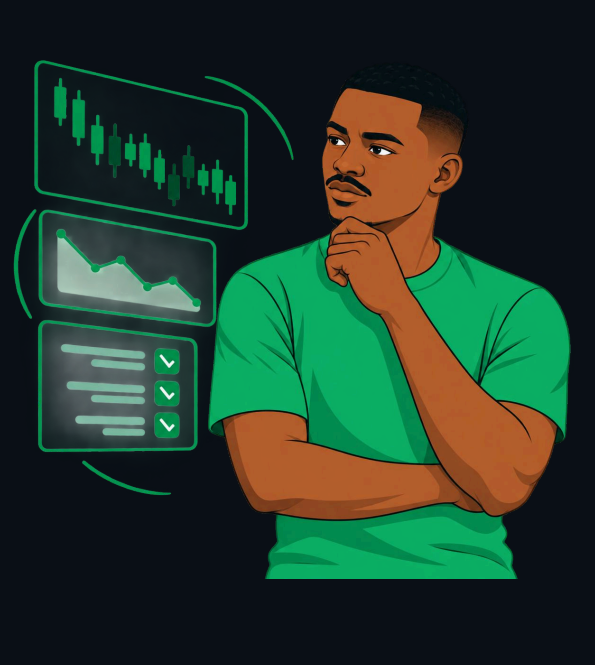
Why I made this Project

My trading experience inspired me to build EdgeTracker. I struggled to achieve consistent profitability and often found it difficult to identify where my decisions were going wrong. I wanted a way to track my entire trading process, including my trade plans, decisions, behaviour, market conditions, news events, and daily performance, to better understand my mistakes and identify patterns affecting my results.

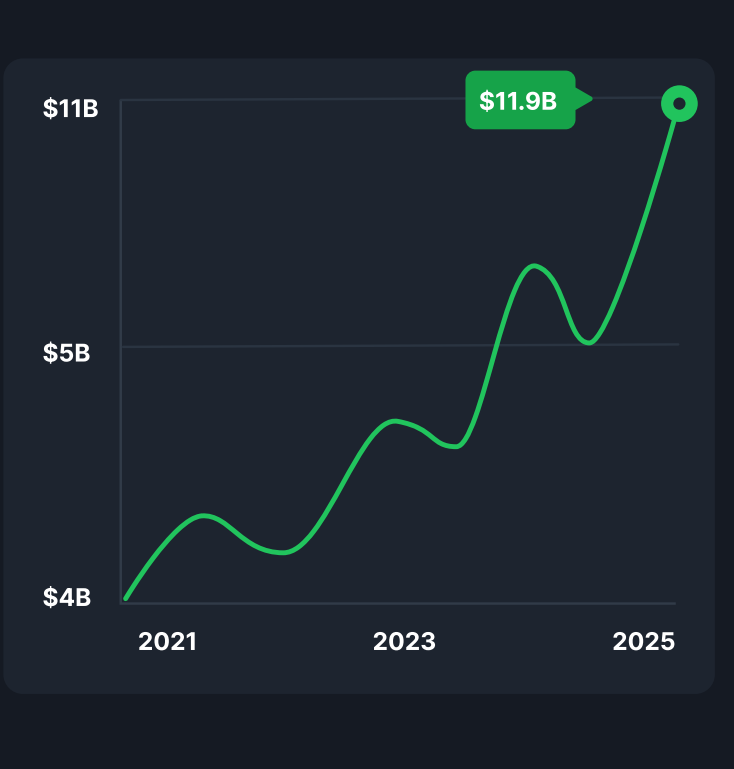
This led me to design EdgeTracker, a trading journal and performance tracking platform that connects trade planning, execution, behavioural analysis, and market context in one continuous experience, helping traders understand not just their results, but the decisions and conditions behind them.



Market Research

Market Research Summary

The trading journal market is already competitive, with established platforms offering trade tracking, performance analytics, behavioural insights, discipline tracking, and risk management.
My research revealed an opportunity to explore a more proactive, mobile first experience one that helps traders recognize risk, protect their progress, and stay accountable to the limits they set.
This shaped EdgeTracker around a simple goal: help traders stay in control while understanding the behaviours affecting their performance.



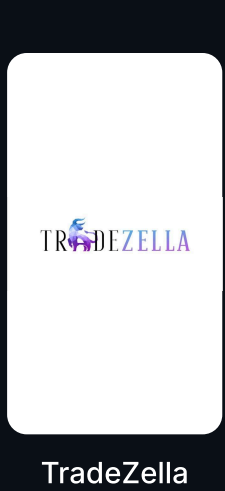
Market Growth

The trading software market is growing rapidly, with the global stock trading analysis software market estimated at $11.18B in 2025 and projected to reach $38.65B by 2032. This growth reflects increasing demand for tools that help traders analyse performance, behaviour, and decision making.

Competitive analysis

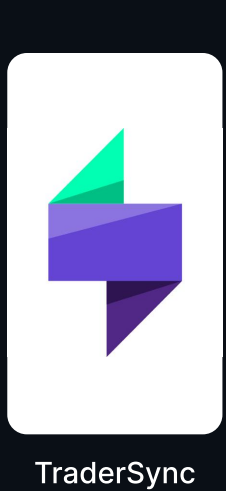
Existing trading journals offer powerful analytics, automation, psychology tracking, and AI. However, the research showed an opportunity to make the relationship between performance and trader behaviour more central to the experience.

This became a key direction for EdgeTracker: helping traders not only review their results, but understand the behaviours and decisions behind them.



TradeZella

Edgewonk



TraderSync

The Positive

- **TradeZella:** leads on automation & polish (AI insights, 500+ brokers, replay, backtesting). strong all around feature depth. Monthly pricing
- **TraderSync:** leads on reach (950+ brokers, native mobile app). Solid AI coaching on top tier. Flexible for mobile first traders.
- **Edgewonk:** leads on discipline/psychology (Tiltmeter, behavior tagging) a real moat. Best value with flat annual pricing.

The Negative

- **TradeZella:** monthly cost adds up; psychology tracking is shallow (just tagging, no real discipline mechanic)
- **TraderSync:** full AI coaching locked behind priciest tier; no distinct behaviour discipline feature
- **Edgewonk:** weakest automation (fewer brokers, no replay back testing, no mobile app); discipline tracking is fully manual, nothing auto detected

Problems from the comments

should include commodities such as oil gold, etc. Tried to find Xauusd but could not find. Not work for gold trader like me.
Khoi Nguyen Minh

XR
Terrible UI, but a bit useful and also backtesting doesn't fully match real TradingView
xr

MO
It seems like a good journal but I can't edit a close trade (must delete / re-enter). lastly support went unresponsive after initial reply.
moe

User Survey

My experience as a trader initially shaped the problem I wanted to explore. I then used survey responses and feedback from other traders to test whether these challenges extended beyond my own experience.

What is the most important factor you take into account while journaling?

15 Participants

Risk Management & Position Sizing	20%
Strategy Adherence & Rules Compliance	45%
Emotional Awareness & Discipline	38%
Consistency & Journaling Frequency	32%
Post Trade Reflection & Visual Context	62%

Notable comments

should include commodities such as oil gold, etc. Tried to find Xauusd but could not find. Not work for gold trader like me.

EdgeTracker help traders recognize when they're drifting away from the process they themselves defined

Initial Research Shows

A mature and competitive trading journal market, with existing platforms covering performance analytics, behavioural insights, discipline, and risk management.
The opportunity I identified was to make these capabilities more proactive and connected helping traders define their limits, recognize when their behaviour is putting progress at risk, and take action before small mistakes become costly patterns.
This became the foundation of EdgeTracker: a mobile first trading experience that connects trade planning, execution, review, risk monitoring, and behavioural insights to help traders stay in control of their process.

Personas

I created two personas to represent the two primary user types identified during my research: traders who connect their trading accounts for automated tracking, and traders who manually record and manage their trading activity.

Nwankwo Vincent
Swing Trader
Every trades leaves a lesson. EdgeTracker helps you find it.

Goals	Frustrations
Follow his trading rules.	Important trading information is scattered across different tools.
Maintain consistent risk management.	Reviewing trades doesn't always reveal why mistakes keep happening.
Understand what is affecting his performance.	Mistakes are obvious in hindsight, but hidden in the heat of a trade
Identify recurring behavioural patterns.	Performance metrics lack decision context.

Description

31 · Futo · Owerri, Imo state

Vincent is an active retail trader who manages his own account and uses technical analysis to identify swing trading opportunities. He plans his trades carefully but sometimes struggles to maintain consistency when emotions, losses, or changing market conditions affect his decisions.

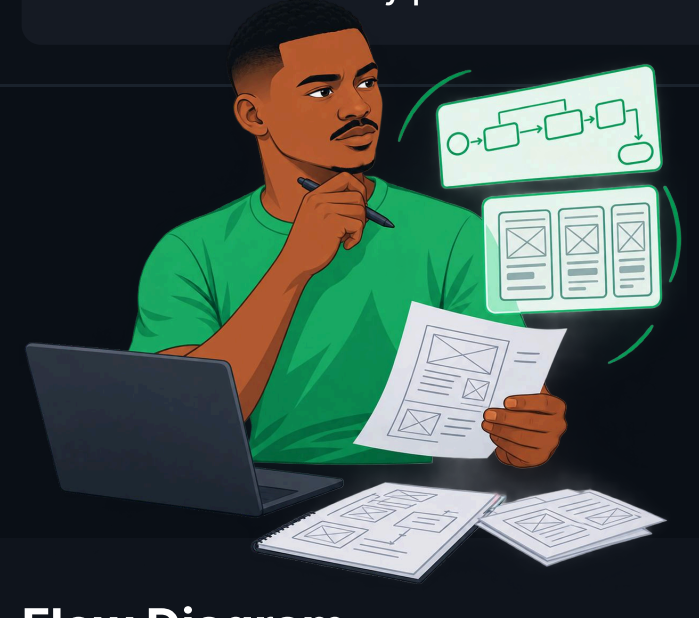
Goals	Frustrations
Maintain proper risk management on every trade.	Missing good setups and taking trades that don't meet my rules.
Identify recurring behavioural patterns.	Reviewing trades without fully understanding the reasons behind repeated mistakes.
Understand what affects my trading performance.	Struggling to connect my trading journal, execution, and performance metrics.
Build consistency and discipline as a price action trader.	Finding it difficult to maintain consistency despite having a tested strategy.

Description

20 · COOU · Nnewi, Anambra state

Johnpaul is a 20-year-old active swing trader who uses technical analysis and pure price action to find high-probability setups. He trades market structure, support and resistance, and break-and-retest entries, with disciplined risk management. Through journaling, backtesting, and performance review, he is working to understand his trading psychology, spot behaviour patterns that affect his results, and become consistently profitable.

Anochili J. Ikenna
Price Action Trader
Discipline turns good setups into consistent profit.



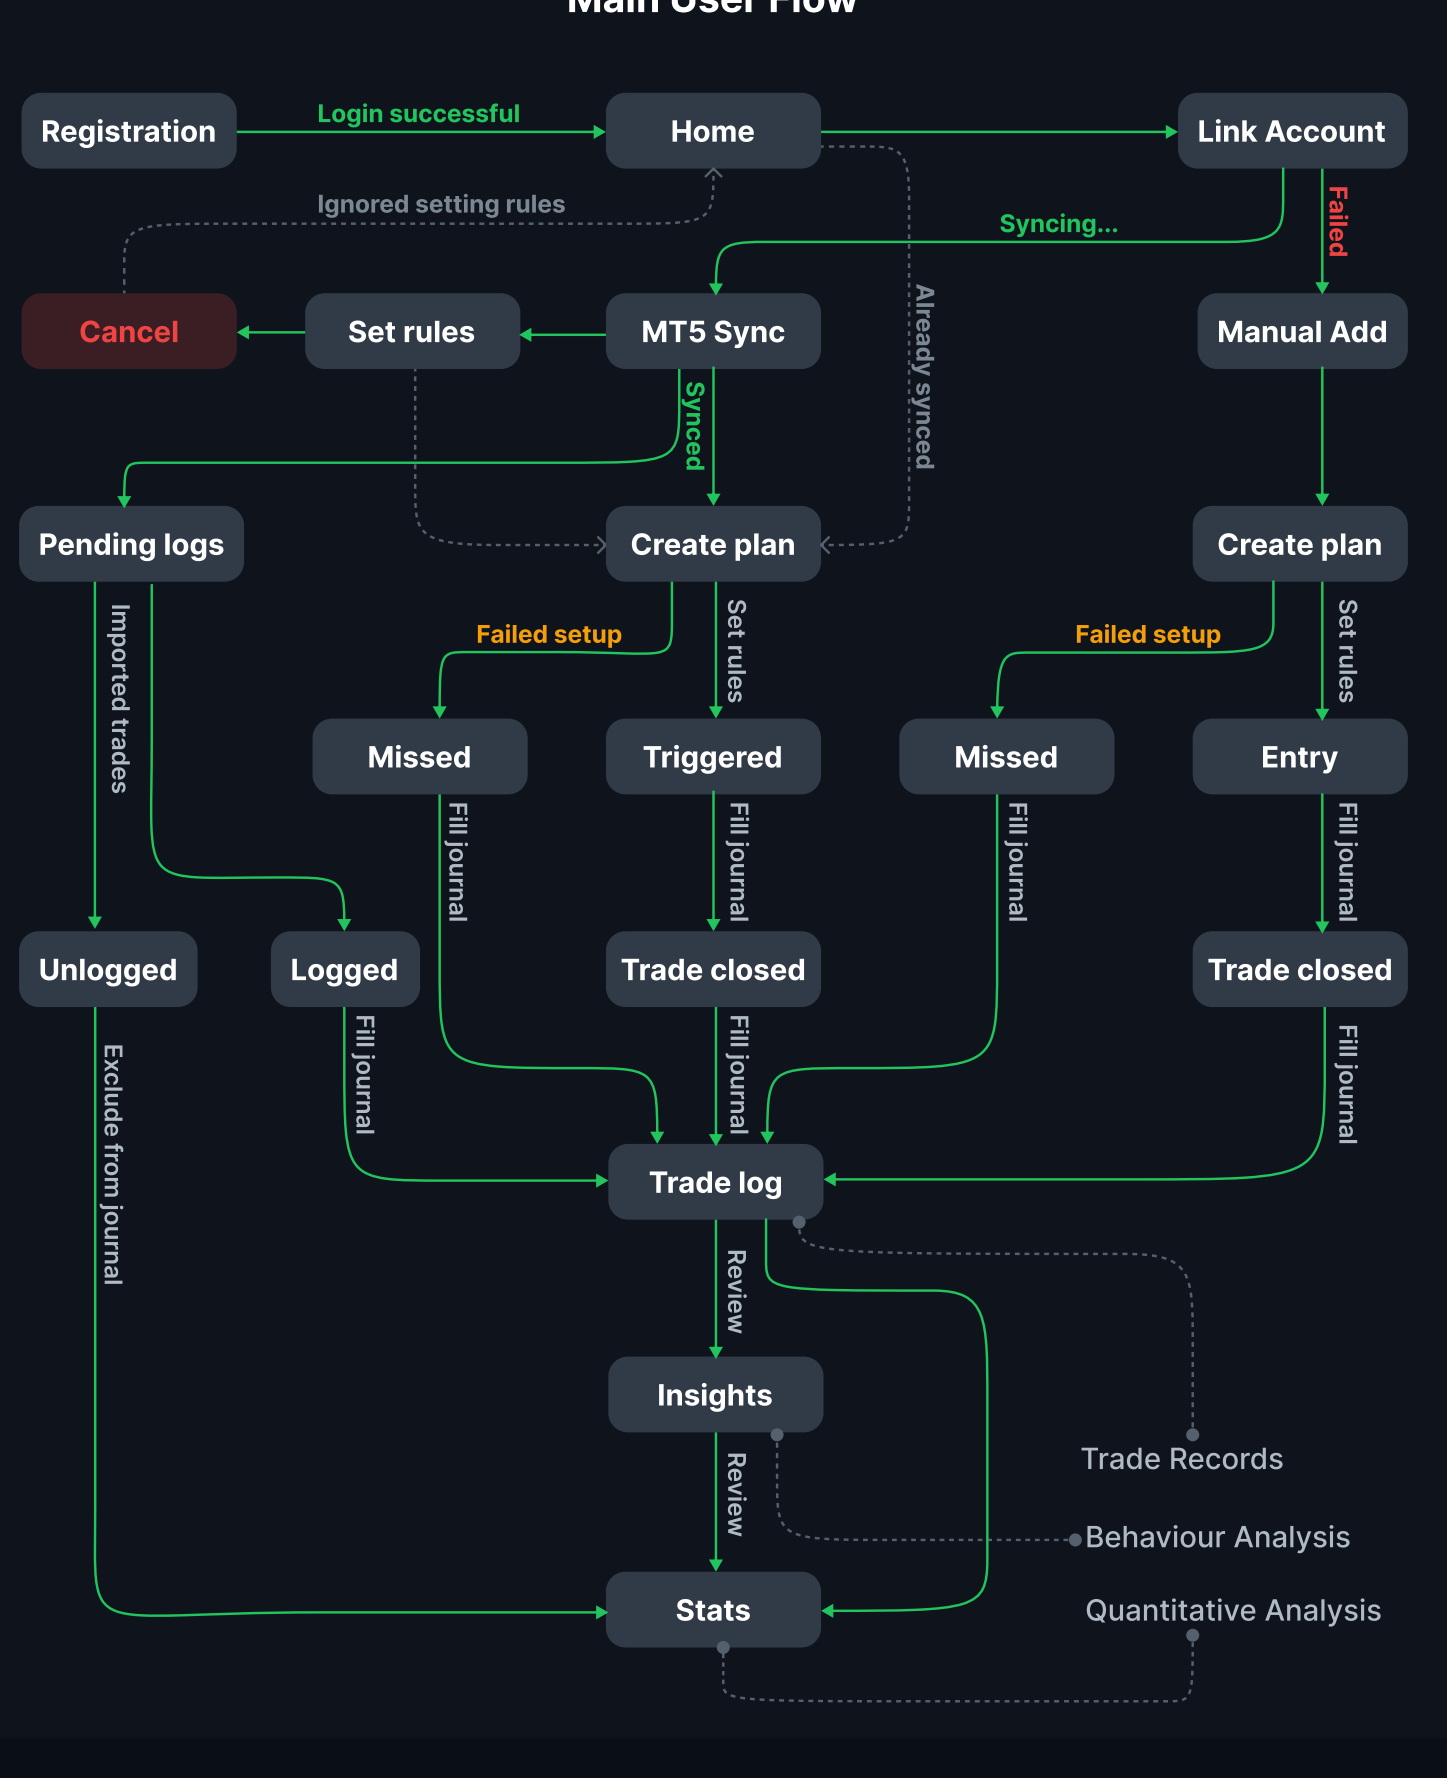
Time to start designing

once I went through my research data it was time to sketch out the first flow and the initial low fidelity wireframes

Flow Diagram

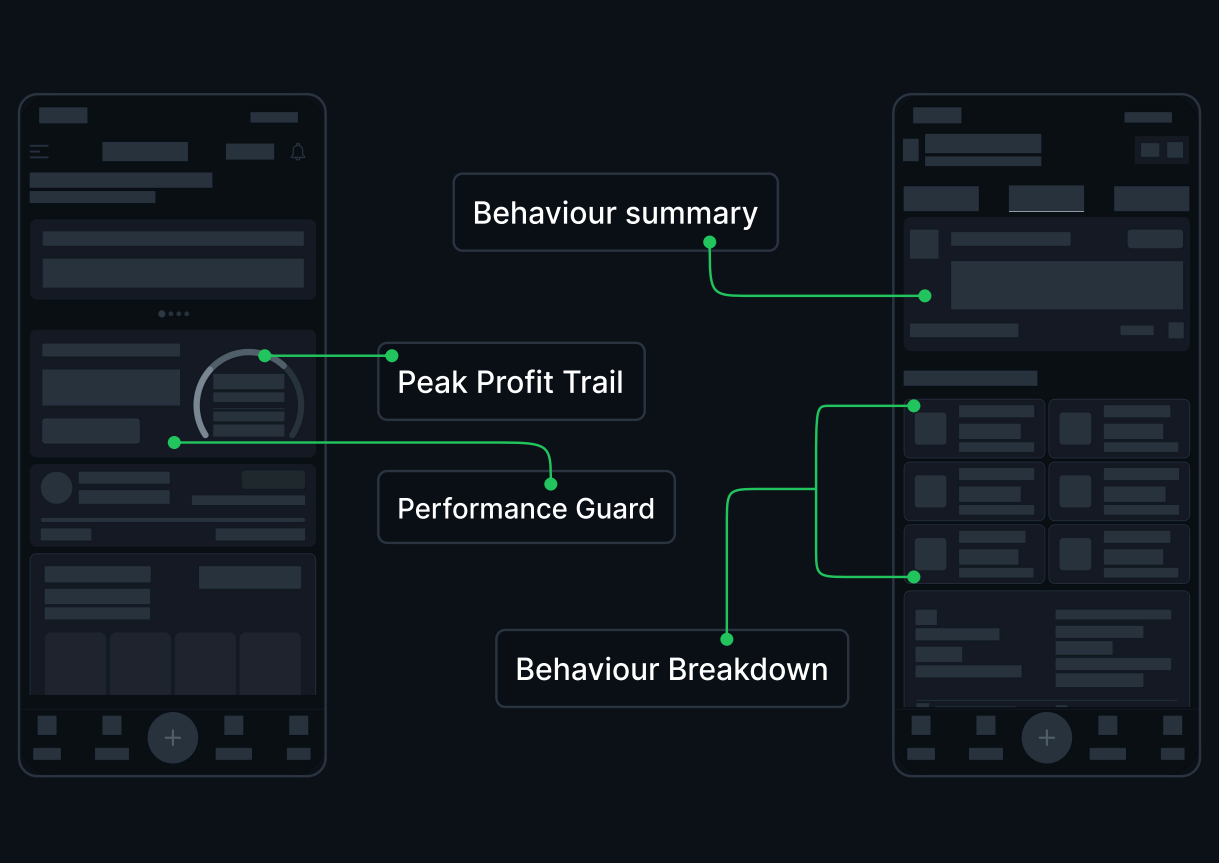
To outline all the necessary functionality I created a simple flow diagram of the main tasks the user can do. One of the flows is shown below. Fail state flow were also created but are not shown due to space constraints.

Main User Flow



Low-Fidelity Wireframes

To outline all the necessary functionality I created a simple flow diagram of the main tasks the user can do. One of the flows is shown below. Fail state flow were also created but are not shown due to space constraints.



High-Fidelity Wireframes

Once the main flow was complete.I started by creating a couple of the main screens of the app. I started by defining the fonts and colors.

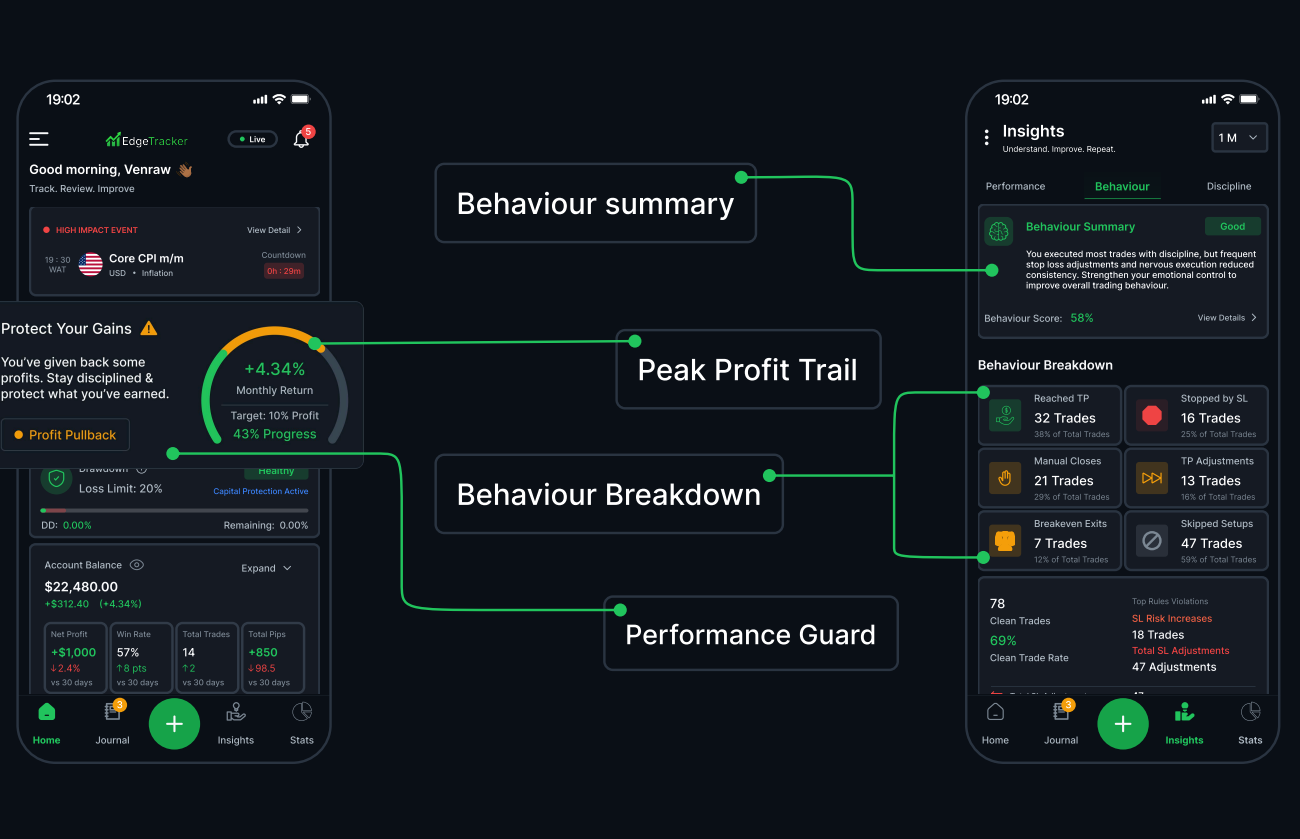
Color palette
Accent, Primary, Secondary, Tertiary, background

● ● ● ● ●

Main CTA button color

Fonts
San serif, Inter

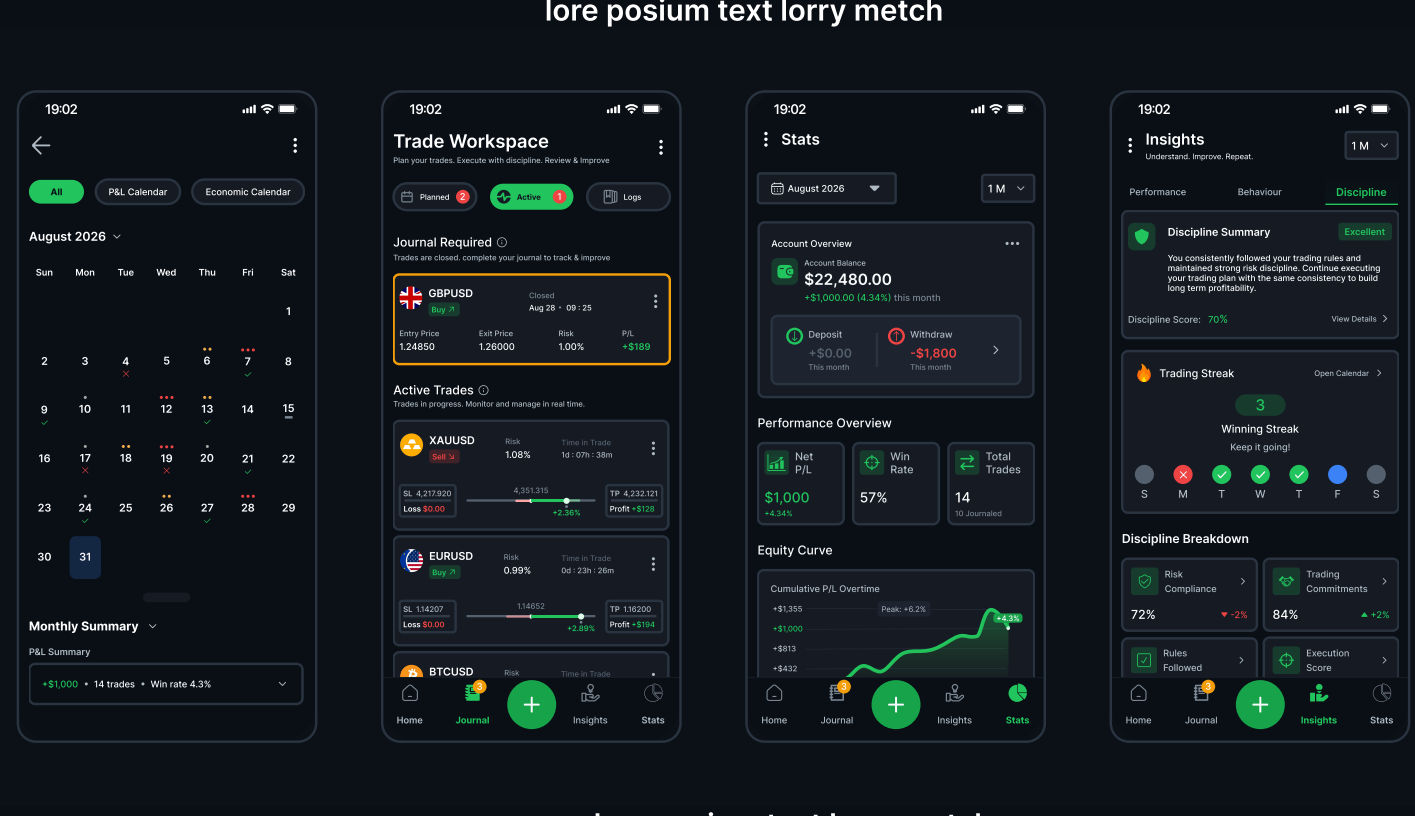
AaBbCcDdEfGgHh



39 High-Fidelity Screen were cretaed

Including two state, manual account mode connection and connected accound mode, loss screen and a profit screen and also empty state.

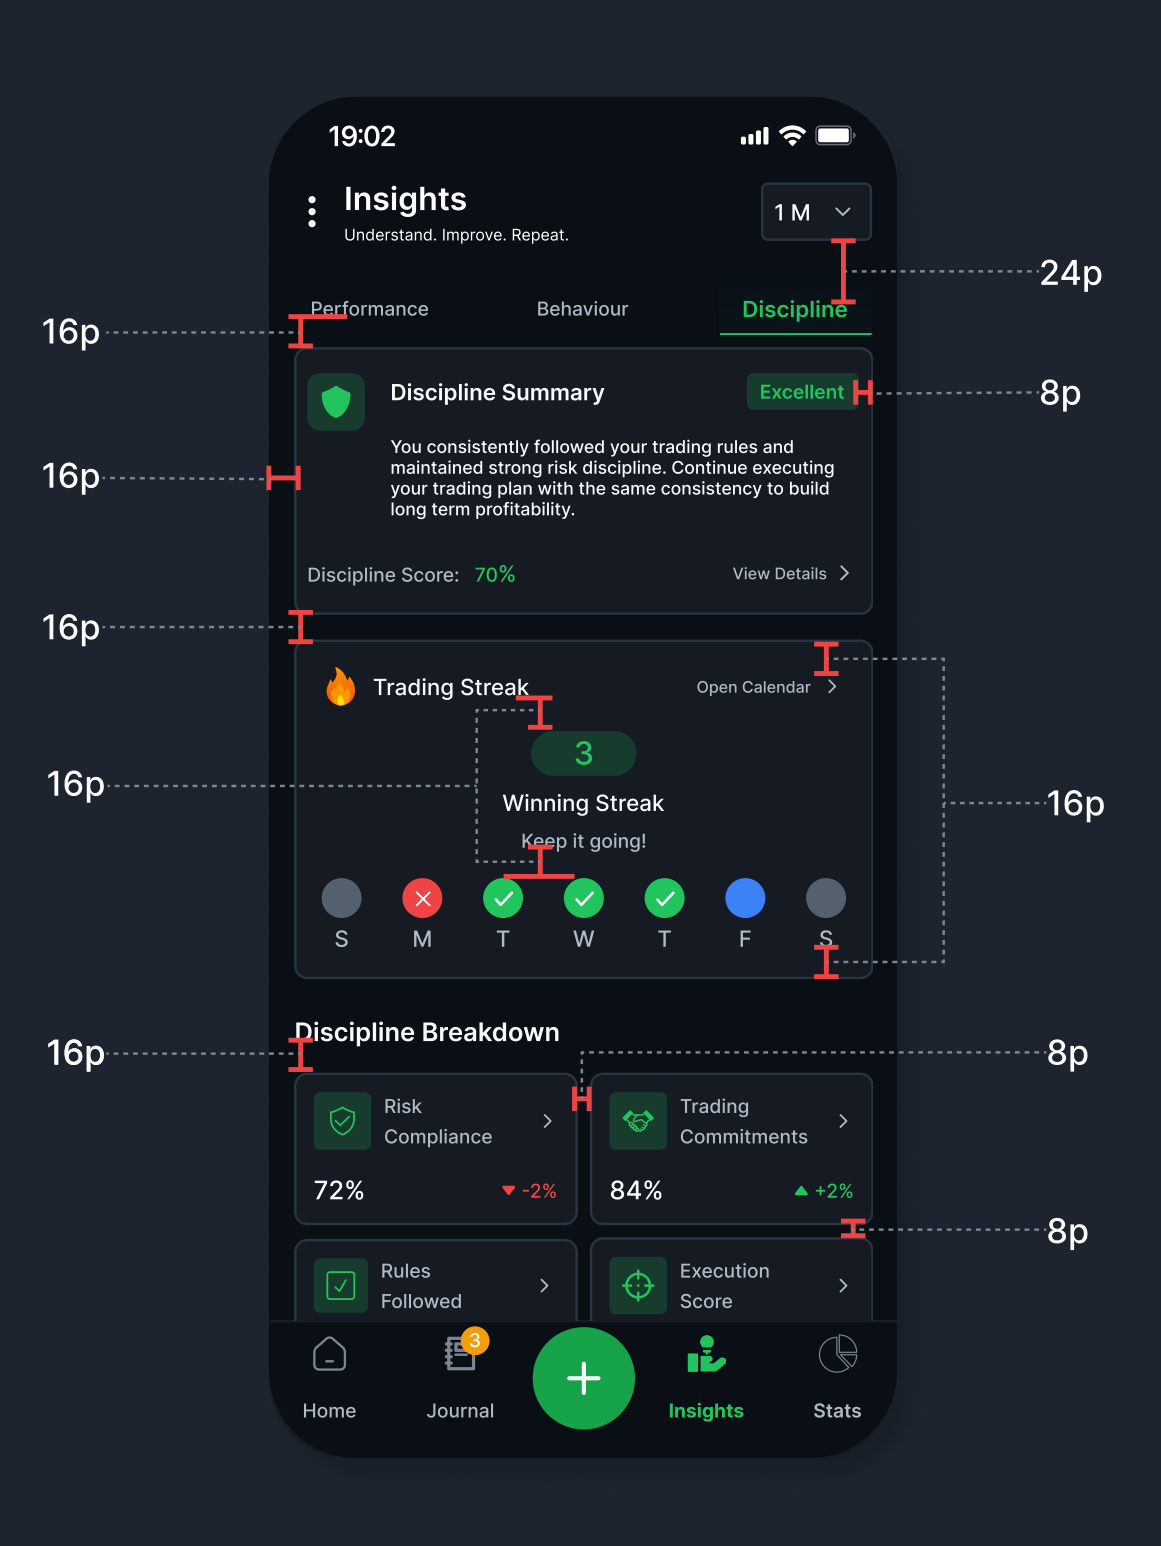
lore posium text lorry metch



lore posium text lorry metch

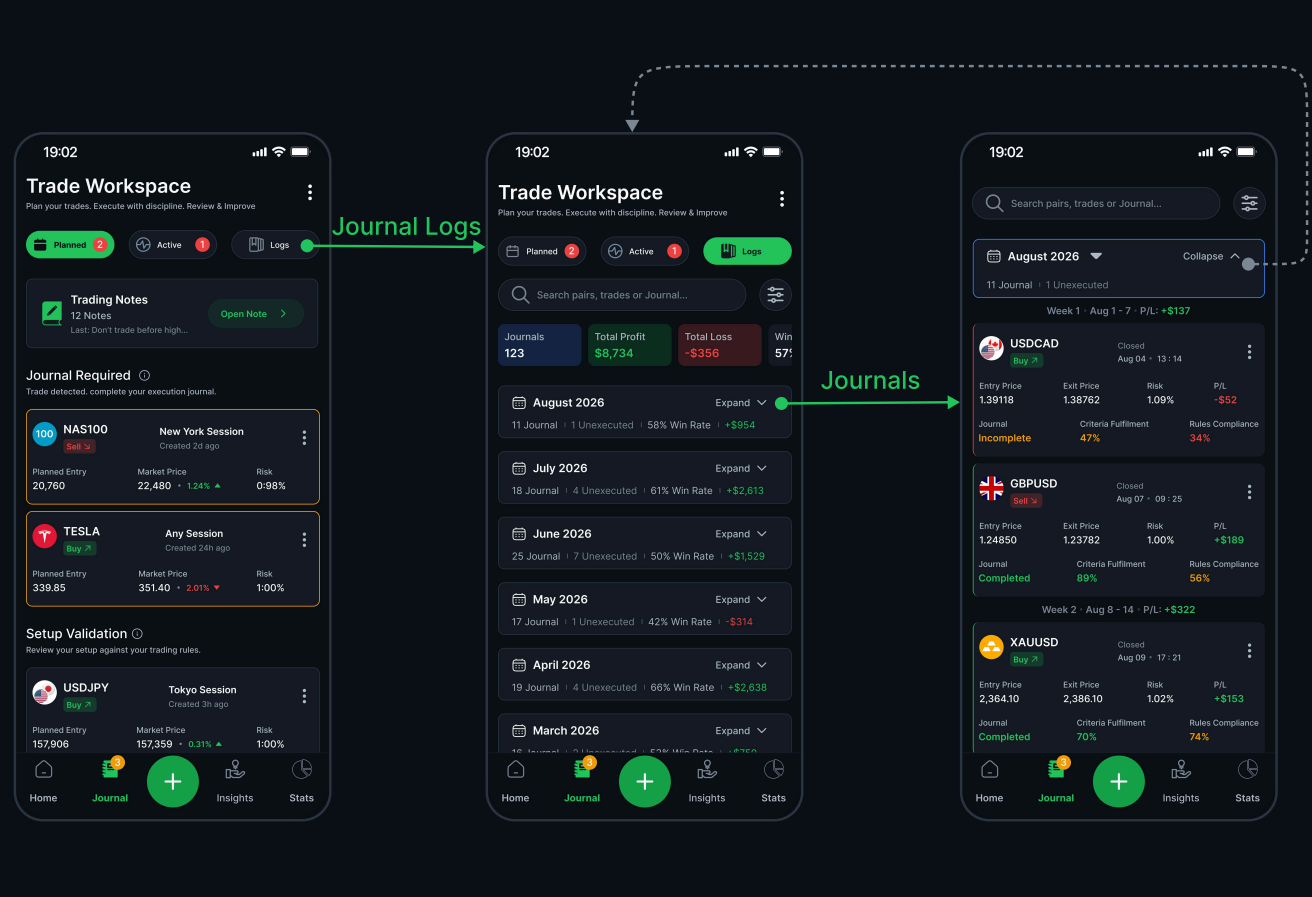
Alignment and Grid

I picked an 8 point grid for the project and set the margin for within groups at 8 and 16, with margins between groups 16, 24, 32 and 48



High-Fidelity Prototype

I connected my high-fidelity designs into a clickable prototype, that will allow me to test the app on a first group of users. This prototype includes the Journal redesign that came out of testing. See **Prototype Validation** for what changed and why.



this is the link to the prototype: https://www.figma.com/proto/PljoY75BSOKnkUVADYkRc6/EdgeTracker?node-id=3883-17411&p=f&t=OsQgjeEUS9TMMmas-1&scaling=scale-down&content-scaling=fixed&page-id=347%3A51&starting-point-node-id=3640%3A6879

Prototype Validation

To check whether the prototype supports a core need, I ran a short usability test with three participants, all of them friends who trade and who were not involved in the design. Each participant used the Figma prototype on phone / desktop and was asked to complete one task, without any help from me.

Study Result

Task

Find the total profit you made from your journaled trades in the current month.

- **1 of 3** participants completed the task without difficulty.
- **2 of 3** participants found it difficult.

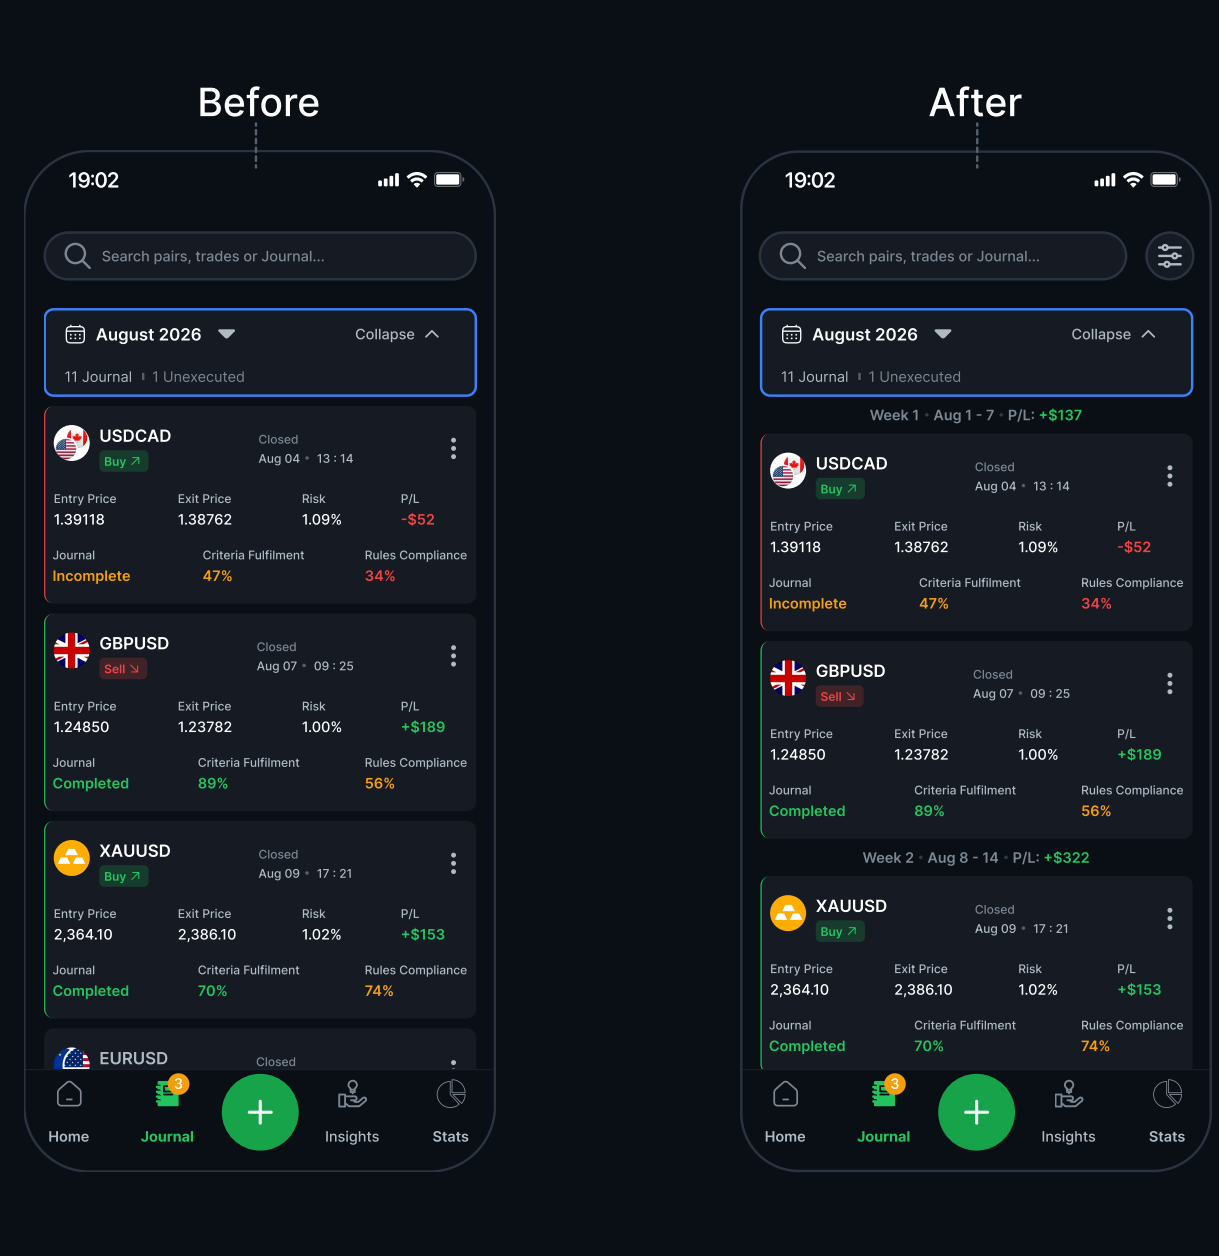
Insight

Traders expect to see their monthly result at a glance. Checking trades individually works for a single day, but it does not scale to a full month. Reviewing performance should be a scanning task, not a calculation.

prototype update concept

What I changed

Participants struggled because the Journal showed every trade as an equal item in one long list, so finding the monthly result meant opening trades one by one and adding them up. I redesigned the Journal so the result is visible before any trade is opened:



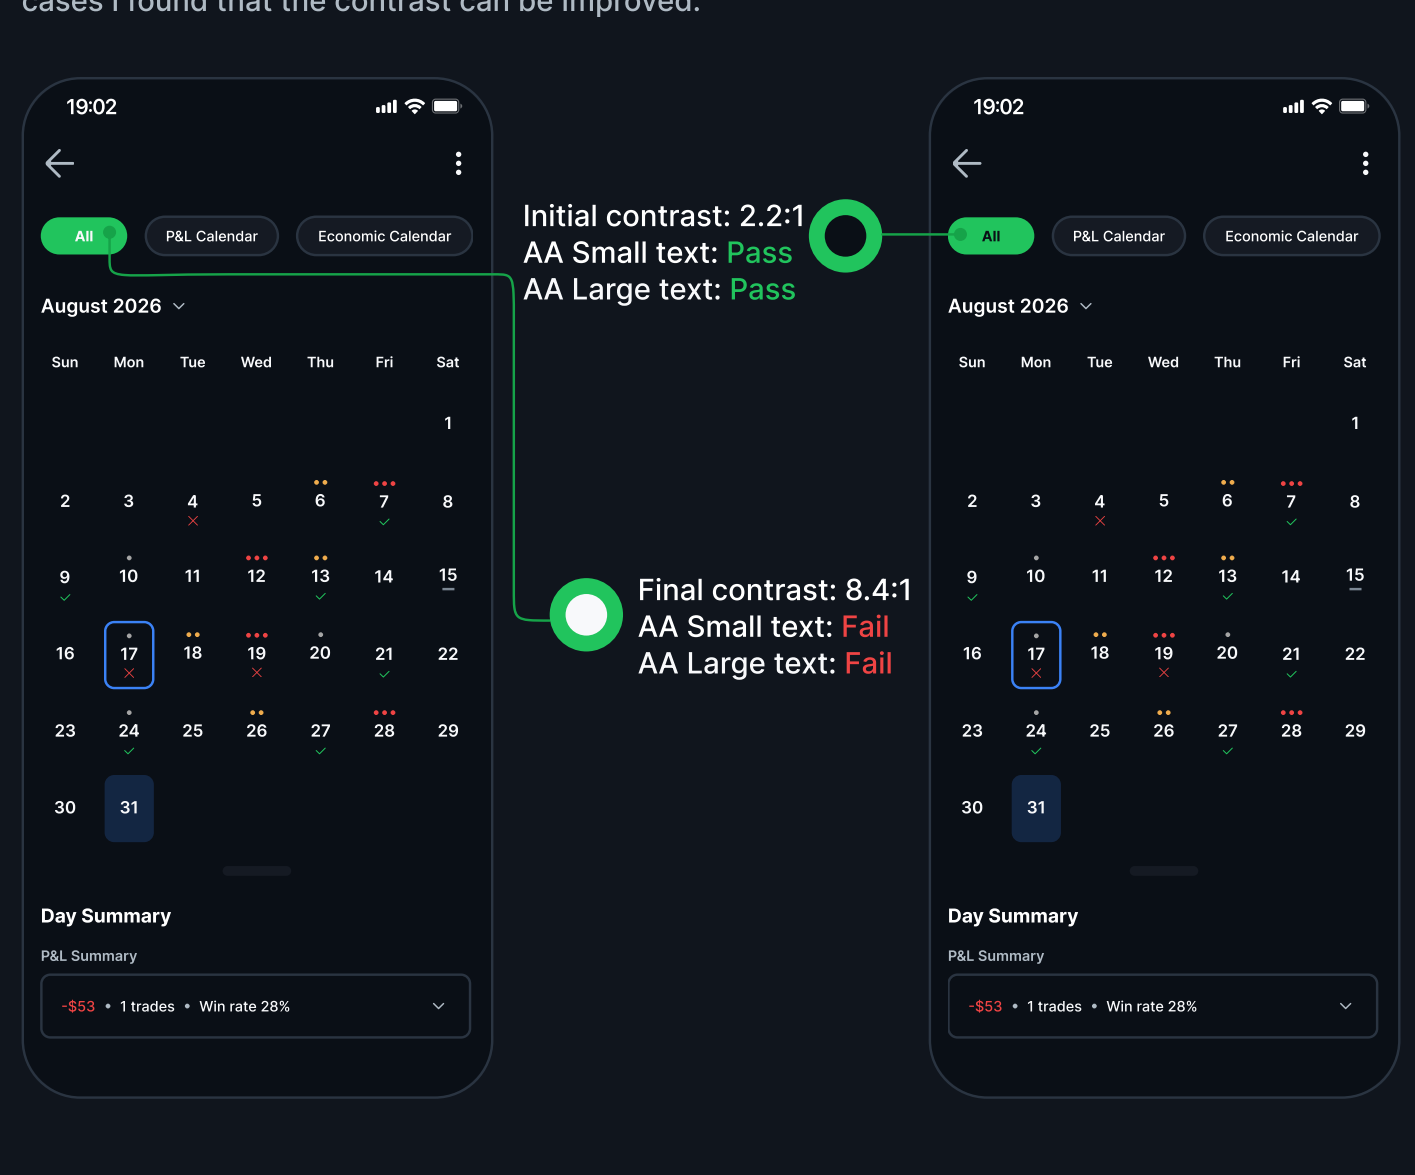
- **Trades are grouped by month.** Each month is a section that can be collapsed, and the collapsed header shows the total profit or loss for that month, coloured green for profit and red for loss. Traders can read a month's result without scrolling through its trades.
- **Each month is split into weeks.** A week header shows its date range and its own P/L, for example "Week 1 · Aug 1–7 · P/L: +$137", so traders can see which part of the month drove the result.
- **A summary line on each month.** shows the number of journal entries and unexecuted trades.
- **Search.** The search bar lets traders go straight to a pair, trade, or journal entry.
- **Filter.** The filter lets them narrow the list by outcome, showing only wins, losses, breakeven, or invalidated trades, so they can review one type of result without scrolling through the rest.
- **Full trade details stay on each card.** (entry, exit, risk, P/L, journal status, criteria fulfilment, and rules compliance), so traders who review a single trade lose nothing.

Retest Result

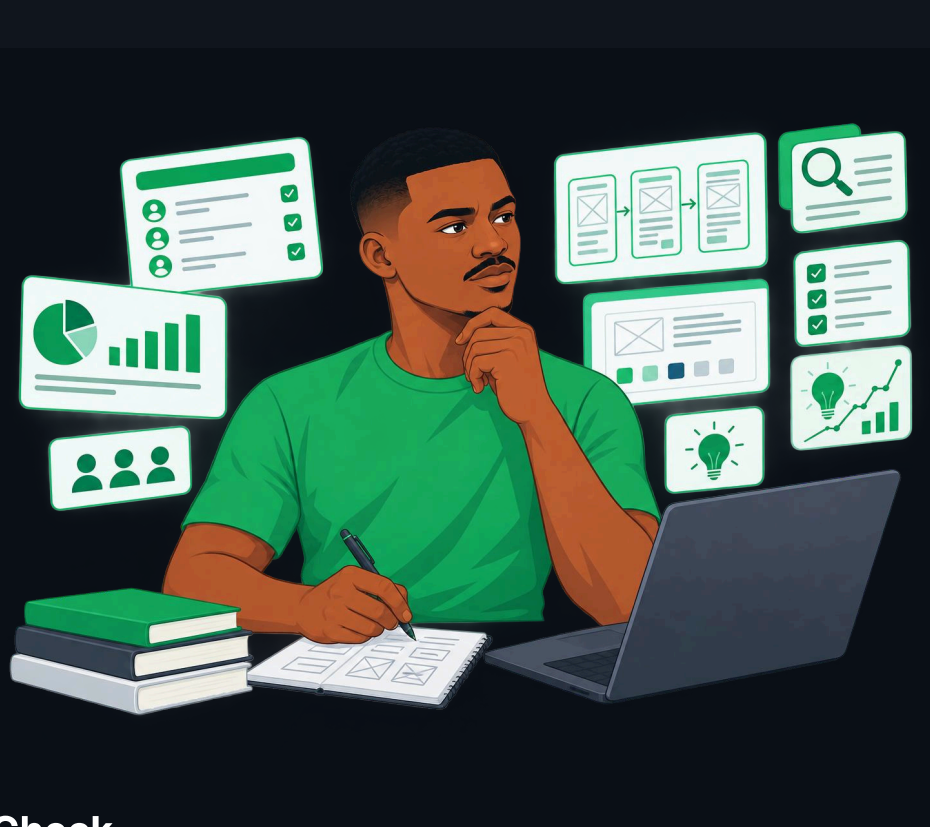
I retested the revised Journal with 3 participants using the same task: find the total profit made from journaled trades in the current month. All the 3 participants completed it without difficulty. Each month now shows its total profit and number of trades, so participants no longer had to open trades one by one or add up results themselves. They also found the layout flexible and easy to scan: weekly sections broke the month into smaller parts, and the filter let them view only wins, losses, breakeven, or invalidated trades.

Acessbility Check

The app has been evaluated for contrast to macth the AA standards of WCAG. In some cases I found that the contrast can be Improved.



One specific example is the active filter chip on the calendar. I used a bright green fill with white text so the selected filter would stand out from the other chips, but the combination had a contrast ratio of about 2.2:1, below the 4.5:1 that WCAG AA requires for normal text. In the final version I kept the green and changed the label to a near-black (#0B0F16), which raises the ratio to about 8.4:1 and passes both AA and AAA, while the chip still stands out clearly from the others.



Acessbility Check

EdgeTracker began with a problem I experienced as a trader: results, behaviour, and market news are spread across different tools. To test whether other traders felt the same, I surveyed 15 active traders using Google Forms and used the findings to shape the product. From there I created wireframes, designed high-fidelity screens, and built an interactive prototype. I ran usability tests with three participants, including a retest after redesigning the Journal, and reviewed the design for accessibility, which led me to fix a colour contrast issue on the filter chip.

What I Learned

I started this project believing my idea was the first of its kind. During competitor research, I discovered that Edgewonk already offers some similar functionality. Rather than discouraging me, this helped me clarify the direction of EdgeTracker. I focused on connecting the trading calendar with both P&L and economic events, exploring how traders could review their performance alongside market conditions and identify potential patterns in news related trading outcomes. I also designed a continuous journaling workflow that connects trade planning, execution, rule adherence, and post-trade review. The project taught me a great deal about the trading industry and how traders approach risk, discipline, and performance review. Those insights helped shape my design decisions and reinforced the importance of building a product that helps traders understand not just their results, but the decisions and conditions behind them.
